

ABSTRACT OF THE DISCLOSURE

The display device includes the lead line connected to pixels, the line terminal connected to the lead line and connected to the terminal of the drive circuit mounted directly on the insulating substrate by the conductive material through the transparent conductive film, the external terminal to be connected to an external unit, an external line connected to the external terminal, and an external line terminal connected to the external line and connected directly to the terminal of the drive circuit by the conductive material. The surface of the line terminal to be connected to the transparent conductive film is formed by the high resistance conductive film, and the surface of the external line terminal to be connected to the terminal of the drive circuit by the conductive material is formed by the low resistance conductive film.
